

AGENTIC OPERATIONS SYSTEM (AOS)

**Your RIS records
the work.**

**An AOS does the
work.**

Five tests to tell the difference.

Swipe →

A CRM is a system of relationships.

A RIS is a system of orders.

An RCM is a system of claims.

An AOS is a system of work.

TEST 1

It performs the work, not the workflow.

Count completed transactions with no human touch, not clicks saved.

Ask: what share of prior authorizations complete end to end?

TEST 2

It spans the whole order.

From the referral to the payment. A coverage problem found at scheduling is fixed before the patient arrives, by the same system.

Ask: who carries it across today?

TEST 3

It works in systems it doesn't own.

Payer portals, referring-office fax lines, a legacy RIS. API, HL7, FHIR, or the browser, the way a person would.

Ask: what happens when the payer has no API?

TEST 4

It scales with volume, not headcount.

More orders shouldn't mean more hiring.
Cost per transaction should fall as volume rises.

Ask: what happens to our cost if volume doubles?

TEST 5

**It escalates by
exception, not by
default.**

Routine work completes on its own.
Exceptions go to a person with the whole
file attached.

Ask: what is your exception rate, by
workflow?

Hold every vendor to these five. **Us included.**

The full definition and the RFP questions.
