AlphaNodus

FAQ

Questions we get asked

Short answers from the Alpha Nodus website.

Does Gravity read scans or write reports?
No. It doesn't touch the clinical read. It handles the work around it: orders, booking, coverage, authorization, payment, and returning the signed report.

What does it do by itself, and what goes to a person?
Routine work runs on its own (reading a fax into an order, checking benefits, texting open slots, submitting authorizations, sending reports). Anything it can't resolve goes to a person in a shared list, assigned by capacity and skill.

Can we control how much a person reviews?
Yes. Each center chooses. For order intake, review every order or only the unusual ones. For authorizations, a record can be set to review every run, finish on its own, or be turned off.

Can I see what it did on an order?
Yes. Changes, communications and automated runs are logged, and each order has a timeline.

What systems does it work with?
It runs alongside the systems you already use. See alphanodus.com/solutions/ris-ehr-integration.

How does a demo work?
Thirty minutes on Google Meet. First 5 minutes: you describe where work slips. Then a fax read into an order, a patient booking from a text, coverage and payment, and the claim worked to paid. Last 5 minutes: your questions.

What is the order trace?
A free 30-minute session where we walk one of your orders from referral to payment and mark every stall. You describe the order in general terms; no patient names. You keep the notes.

What does it cost?
Pricing starts from $1,000 a month, based on plan and monthly exam volume.

Do you need to add staff?
Iowa Radiology reports they did not add staff after Gravity went live.

How do patients book?
They get a text with open times and book from their phone. At Downtown Radiology, 56.5% of texted patients booked themselves.

Is patient data secure?
Gravity Trust covers single sign-on, user permissions and an audit trail. See alphanodus.com/products/gravity-trust.
